the presence of ATP and magnesium. Alpha-casein is the usual test substrate. In the absence of ATP, only oligopeptides shorter than five residues are cleaved (such as succinyl-Leu-Tyr-|-NHMEC; and Leu-Tyr-Leu-|-Tyr-Trp- in which the cleavage of the -Tyr-|-Leu-SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            STRIN-Berkeley;

It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch). INDUCES MORPHOGENESIS OF INAGINAL DISKS, AND MAY PARTICIPATE IN DULTIMOLECULAR AGGREGATES.

SUBCELLUAR LOCATION: SECRETED FROM THE APICAL CELL SURFACE. DEVELOPMENTAL STAGE: PRODUCED DURING MID EMBRYOGENESIS, AND MAGINAL DISK MORPHOGENESIS.

DOMAIN: THE REGIONS 203-253, 256-333 AND 335-377 ARE THOUGHT TO CONTAIN EITHER ALPHA HELICAL OR BETA PLEATED SHEET MOTIFS. 1 (APPROXIMATE).

L. FUNCTION: Structural protein involved in the filamentous cross-
I. FUNCTION: Structural protein involved in the filamentous cross-
I. SUBUNIT: 3 different light chains, LC1, LC2 and LC3, can associate
I. SUBUNIT: 3 different light chains, LC1, LC2 and LC3, can associate
I. SUBUNIT: 3 different light chains, LC1, LC2 and LC3, can associate
I. SUBUNIT: 3 different light chains, LC1, LC2 and LC3, can associate
I. SUBUNIT: 3 different light chains, LC1, LC2 and LC3, can associate
I. STORY SERVENCIONES: 2 isoforms; a long form (shown here) and a
Short form; are produced by alternative splicing.
I. ALTERNATIVE PRODUCTS: 2 isoforms; a lightly expressed in brain, and
I. ALTERNATIVE PRODUCTS: 2 isoforms lightly expressed in classer extent in other tissues including heart and muscole.
I. DOMAIN: THe basic region contraining the repeats may be responsible for the binding of MAPIA to microtubules.
I. PUN: Various serine residues may be phosphorylated by CAMP kinase

The complete genome sequence of the lactic acid bacterium Lactococcus lactis structis IL1403.";
Genome Res. 11:731-753(2001).

FUNCTION: This protein is involved in the repair of mismatches in bush. It is possible that it carries out the mismatch recognition step. This protein has a weak APPase activity (By similarity).

SIMILARITY: BELONGS TO THE DNA MISMATCH REPAIR MUTS FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lactococcus lactis (subsp. lactis) (Streptococcus lactis).
Bacteria: Firmicutes; Lactobacillales; Streptococcaceae; Lactococcus.

                                                                                                                                                                               -!- NATERNATIVE PRODUCTS: At least 2 isoforms; Fit1 (shown here) and SFIt1; are produced by alternative splicing.
-! TISSUE SPECIFICITY: Mostly in normal lung, but also in placenta, liver, kidney, heart and brain tissues. Specifically expressed in peripheral blood monocytes. It is not expressed in peripheral blood monocytes. It is not expressed in tunes. Isoform sFIt1 is strongly expressed in tune. SIMILARITY: BELONGS TO THE CSF-1/PDGF RECEPTOR FAMILY OF TYROSINE-
         Vascular permeability. Isoform SFlt1 may have an inhibitory role in anglogenesis.
                                                 -!- SUBUNȚT: Interacts in vitro with various phosphotyrosine-binding Proteins, including PLC-gammas, PTPN11, GRB2, CRK and NCK1.
                                                                                                                 tyrosine phosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             BY SIMILARITY.

                                                                                                                          The peptide may be prepd. by completely digesting casein in soln. with a proteolytic enzyme, adding mineral acid to the soln. to adding the 4 to 4 '', removing any precipitate, adding calcium schloride to cause aggregation of the peptides in soln. and separating the aggregated phosphopeptides. This method allows proof the phosphopeptide by industrial methods. The phosphopeptide has anticariogenic activity and may be used as a dietectic. The supplement or as a fertiliser. Supplement or as a fertiliser.

The sequences given in AAR32927-35 are casein phosphopeptides which can be used to inhibit dental calculus. These peptides are pref. in the form of salts selected from alkaline metal, alkaline earth metal salts such as Na, Ca, Zn, Cu, Al, K, Sr, Mg and Ni salts. These peptides peptides peptides have anti-calculus potential, and are anti-caries and anti-caries and anti-
                                                                                                                                                                                                                                                                                                         Gaps
Controlling dental calculus by treating teeth with oral compsns. which contains phospho-peptide(s) having 5-40 amino-acyl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Casein phosphopeptide; dentinal hypersensitivity; therapy; tooth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ser(P) - post-translationally phosphorylated serine. A mixture of casein phosphopetides (CPP) and/or their salts may be used in a method for treating dentinal hypersensitivity. Pref. those CPPs contg. the sequence -Ser(P)-Ser(P)-Ser(P)- predominate. The CPPs can be extracted from a casein digest.
                                                                                                                                                                                                                                                                                                       ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a stable calcium phosphate complex including phosphopeptide stabilised amorphous calcium phosphate (ACP) or its christian phosphopeptide includes the amino acid sequence: derivative, where the phosphopeptide includes the amino acid sequence: Ser(P)-Ser(P)-Glu-Glu. The amorphous phases stabilised by the phosphopeptide for co-localisation of Ca, phosphopeptides are a delivery vehicle for co-localisation of Ca, and phosphate at the tooth surface in a slow-release amorphous form producing superior anticaries efficacy over prior art. The amorphous producing superior atticaries efficacy over prior art. The amorphous phosphopeptides are also useful as dietary phases stabilised by the phosphopeptides are also useful as dietary calcium cappelements to increase calcium deficiencies. They are particularly useful for treatment or prevention of dental caries, calcium cappelements of dental caries, calcium cappendicions are useful in humans and in veterinary medicine in the compositions are useful in humans and in veterinary medicine in the capp.
                                                                ö
                                                                                                                                                                                                                                                                                                                  casein; calcium phosphate complex; amorphous calcium phosphate; ACP; phosphopeptide; delivery vehicle; calcium fluoride; calcium deficiency; osteoporosis; osteomalacia; tooth; bone disease.

The native form of bovine beta-casein Al contains various pepsin cleavage sites. Esterification of the protein with methanol or ethanol results in a form of beta-casein contg. additional, non-conventional pepsin cleavage sites (see Features Table). Esterified peptides and amino acids (and their mixtures) resulting from hydrolysis of an esterified protein (pref. beta-lactoglobulin or beta-casein) are claimed. The hydrolysis products are useful as ingredients, additives or active agents in foods, pharmaceuticals and cosmetics.

The invention relates to a dietary supplement which, when consumed, cc is capable of reducing plasma levels of homocyst(e)ine (tHcy). tHcy is compared to reducing plasma levels of homocyst(e)ine (tHcy). tHcy is cc a major risk indicator of heart disease and vascular disease in general major risk indicator of heart disease and vascular disease in general cc factor for mortality in type II diabetic patients. Deficiencies in folic acid acid, pyridoxine and cobalamin lead to higher tHcy levels, and folic acid deficiency is known to be involved in vascular disease, as well as causing neural tube defects in early embryonic development. The causing neural tube defects in early embryonic development. The dietary supplement of the invention comprises milk or a milk product, dietary supplement of the invention comprises and milk product, cor their analogues. In addition, the beta-casein component of the milk is or their analogues. In addition, the beta-casein component of the milk is substantially the A2 variant. Beta-casein types A1 and B, consumption of substantially excluded from the supplement. The dietary supplement is useful for reducing the incidence of type I diabetes, are particularly excluded from the supplement. The dietary supplement is comparable and is also useful for reducing the incidence of type I and II.

C particularly cardiovascular disease and cerebrovascular disease, contable the additionally provides a sufficient daily dose of folic acid diabetes. It additionally provides a sufficient daily dose of folic acid contable improvements to a human population without the administration of medication. The present sequence represents bovine beta-casein type A2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Caries; gingivitis; periodontal disease; osteoporosis; osteomalacia.
                   prophylactic dietary supplement for reducing incidence of cardio, cerebro vascular diseases and diabetes in a population, contains milk or its products fortified with betaine, cobalamin, folic acid or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                             Selecting non-diabetogenic milk and milk prods. - by testing milk or cows for the presence of non-diabetogenic variants of beta-casein
                                                                                                                                                                                                                                                                                                                                                                                                             A method for selecing milk for feeding to diabetes suscetible individuals comprises testing milk from identified cows for the presence of variants of beta casein and selecting those cows whose milk contains non-diabetogenic variants and milkking these cows separately. The milk and milk products obtained can reduce the risk of susceptible individuals contracting Type-1 diabetes.

Novel phosphopeptides - useful for treating dental diseases, rarefying diseases or diseases relating to malabsorption of minerals
                                                                                              This is an example of a highly generic formula for a phosphopeptide of length 5-13 amino acids. The peptides can be made synthetically (e.g. chemical synthesis or genetic engineering) or they can be extracted from cereals, nuts or vegetables or by fractionating a compositions comprising the peptide may take the form of foodstuff topical application to teeth or gingival tissue. The peptides impulmentable application to teeth or gingival tissue. The peptides significantly increase absorption of calcium, phosphate and iron in the gut. See AAR14447-R14451.

These peptides are pref. in the form of salts selected from alkaline metal, alkaline earth metal salts
                                                                                                                                                                   .;
0
       The peptide may be prepd. by completely digesting casein in soln.

with a proteolytic enzyme, adding mineral acid to the soln. to
adjust the pH to 4.7, removing any precipitate, adding calcium
adjust the pH to 4.7, removing any precipitate, adding calcium
chloride to cause aggregation of the peptides in soln. and
separating the aggregated phosphopeptides. This method allows prodn.
of the phosphopeptide by industrial methods. The phosphopeptide
has anticariogenic activity and may be used as a dietectic. The
peptide may be used in a microbiological growth medium, as a dietary
supplement or as a fertiliser.

The sequences given in AAR31237-42 represent phosphopeptides which were used as the active agents in an oral composition. These peptides were stabilised by an anionic polymeric stabiliser. The anionic polymers were chosen from a group consisting of carboxylate polymers, sulfonate polymers, polymers having both a carboxylate and polymers, sulfonate moiety, and other such mixtures. The anionic polymeric a stabiliser inhibits destabilisation of the phosphopeptide in the oral stabiliser inhibits destabilisations, pref. containing a fluoride source may be used for inhibiting caries and gingivitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Phosphopeptide; active agent; oral; composition; anionic; polymeric; stabiliser; carboxylate; polymer; sulfonate; destabilisation; fluoride; caries; gingivitis.

peptides (AAR68936-40) are phosphopeptides resulting from the tryptic digestion of sodium caseinate. The peptide shown here is derived from the TCPK-tryptic digest of beta-caseinate. The peptides contain the amino acids phosphoserine, phosphothreonine, phosphotyrosine or phosphopeptides, and include in their sequence aspartate and glutamate. The phosphopeptides form part of a novel composition containing the peptide dispersed uniformly in a crystal mix of sugars chosen from peptide dispersed uniformly in a crystal mix of sugars chosen from sorbitol, mannitol, xylitol, lacticol, cellobiitol or mixtures of sorbitol, mannitol or sorbitol/xylitol. The compositions can be used sorbitol/mannitol sugars to manufacture confectionary products. Instead of conventional sugars to manufacture confectionary products. The phosphopeptides are known to inhibit caries and gingivitis and can act as a source of calcium ions to promote/enhance remineralisation.
